

Coding Challenge – WorkFlex

Workation Platform

The task for this coding challenge is for you to implement part of a **Workation Platform**. We are interested in your coding skills and how you approach these kinds of tasks.

Introduction

We would like you to set up an application with **Java, Spring Boot and Angular** from scratch. You can use **any additional technologies you like**. Also, you are free to **use the internet** (i.e. Stack Overflow, Baeldung or ChatGPT) as much as you want. This coding challenge aims to be as close to a real-world case as possible. The evaluation criteria are as follows:

- **Completeness of functionality:** The application does what it is supposed to do from a feature-perspective
- **Architecture:** The application was developed with a meaningful architecture in mind
- **Quality + Code Style:** The code adheres to common coding guidelines and best practices
- **Testing:** There are some tests covering the functionality of the application. This can be Unit-Tests, Integration Tests or End-To-End Tests

Task: Show workations as table (2.5h)

We would like you to implement an API endpoint which lists the workations currently in the system. The associated API endpoint URL should be `/workflex/workation`.

Employee	Origin	Destination	Start	End	Working days	Risk
Steffen Jacobs	Germany	United States	02/10/2024	31/12/2024	65	High risk
Steffen Jacobs	Germany	Ukraine	29/04/2023	30/04/2023	1	High risk
Henry Duchamp	Belgium	Spain	01/09/2022	01/03/2023	131	High risk
Andre Fischer	Germany	Greece	22/04/2023	30/06/2023	50	No risk
Ayushi Singh	Germany	India	13/03/2023	30/04/2023	35	No risk

For this task, you need a **database** (e.g. H2, postgres or anything else) to store the workations in.

Since there are no workations in the system when it is initially started, they should be **imported from a CSV file** `workations.csv`. The CSV file should be somehow **imported by the Java application and not manually copied** into the database. When the endpoint is called, the workations from the database should be returned.

The table needs to be sortable by each column. It can be sorted in the frontend or backend. Note that there are two risk levels that are both labelled as “No risk” in the frontend with different colors. One is LOW_RISK while the other one is NO_RISK in the corresponding CSV. The dates should have the same format as depicted in the screenshot (dd/MM/yyyy). When hovering a table row, it should be highlighted in a slightly different color (see the second row in the screenshot).

For the flags, you are free to use Emojis, preloaded images, an Angular library or a flag CDN or anything else that comes to mind.

Please also implement a UI with Angular that looks as close as possible to the screenshot above. There is **no login** or other security measures required. Please include a screenshot of your table in the repository.

Regarding the submission:

- Please submit your results to a **private** GitHub repository.
- Add **`coding-challenge@getworkflex.com`** as a collaborator.
- Please share the link to your private GitHub repository when submitting your solution. This helps us to efficiently match your submission with your application.
- The time limit starts when you receive the challenge files, and **no additional commits** should be made **after the 2.5-hour mark**.

We wish you the best of luck - WorkFlex Team
